

FTAPI security levels

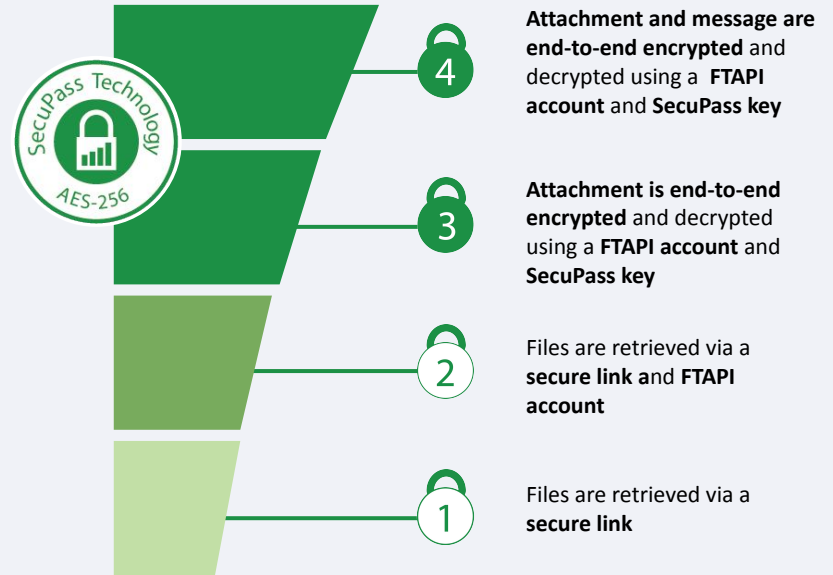

Security tailored precisely to your needs

Maximum security for your data

Countless amounts of data are exchanged every day, both internally and beyond company borders. Much of this data is highly sensitive and should not fall into the wrong hands. With FTAPI, you can choose from four different levels of security depending on the sensitivity of the data. Administrators also have the ability to assign particular security levels when sending internal company data.

- ✔ **Compliance** and **data protection-compliant** communication
- ✔ **End-to-end encryption** for maximum protection
- ✔ **Continuous further development** of our encryption technology for long-term security
- ✔ **Flexible configuration** of the respective security levels
- ✔ Excellent **transparency and tamper-proof**

Security level 1

Secure link

Documents sent using security level 1 are retrieved via a secure link. Anyone with access to this link can open the document and download the files. A FTAPI account is not required here.

You should therefore only send documents intended for general use with this security level – no personal or confidential data. This may include non-critical data such as tender documents or particularly large files such as product brochures or software updates. These documents can be quickly, securely and easily shared using security level 1.

Security level 2

Secure link + login

If data should only be downloaded by certain recipients, security level 2 is recommended. This is because the recipient must have a FTAPI account in order to retrieve the document.

If the recipient does not yet have a FTAPI account, a free guest account is automatically created for them. This is a quick and easy solution for establishing a secure communication channel with external recipients.

Security level 3

Secure link + login + encrypted files

Security level 3 allows sensitive or company-critical data to be sent using end-to-end encryption. The recipient requires a FTAPI account and SecuPass key to decrypt the files. The SecuPass key ensures that files are always sent using end-to-end encryption. This means that nobody other than you and the intended recipient can access the file contents - not even FTAPI.

This allows you to securely transfer employment contracts or payroll accounts, for example. Intellectual property and critical company data are optimally protected with security level 3.

Security level 4

Secure link + login + encrypted files + encrypted message

Security level 4 goes one step further by also encrypting your message to the recipient. All text is consistently end-to-end encrypted. The recipient also requires a FTAPI account and SecuPass key to decrypt the message and files. This ensures that no unauthorised parties get wind of your intentions.

Security level 4 is ideal if you wish to discuss sensitive and company-critical topics such as strategies or plans via email.
